

# IBM Data Science Capstone Project

This Project is to create a model which can recommend the nearest neighborhood in canada to move to using machine learning algorithms and geo api from foursquare

---

## Business Case:-

- **Help people to find the nearest neighbourhood to move to in canada**
  - which most people face an issue to find the best neighbourhood to move to
  - and this issue if solved will make it easier for more people to move and find another work easily
  - create a new life in the new place without a problem and people lives will be better

## Data:-

- **Postal code of Canada**
- **Avenues data from foursquare api**
  - these data will help find the coordinates of the neighbourhood and get the top venues
  - which people can move to without any issue to face and see the map description for the avenue

## Table of Content:

---

- Import Libraries
- Prepare & Clean The Data
- Visualize The Data

In [1]:

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
from geopy.geocoders import Nominatim
import folium
from pandas.io.json import json_normalize
import requests
import matplotlib.cm as cm
import matplotlib.colors as colors

from sklearn.cluster import KMeans
```

In [2]:

```
data = pd.read_html("https://en.wikipedia.org/w/index.php?title=List_of_postal_codes")
df = data[0]
df.head()
```

Out[2]:

	Postal Code	Borough	Neighbourhood
0	M1A	Not assigned	Not assigned
1	M2A	Not assigned	Not assigned

<b>Postal Code</b>		<b>Borough</b>	<b>Neighbourhood</b>

### City Which to find the neighbourhood and nearest avenues

In [23]:

```
# address can be changed to the required city
address = 'Toronto'

geolocator = Nominatim(user_agent='explorer')

location = geolocator.geocode(address)
latitude = location.latitude
longitude = location.longitude
```

## Visualize The Data

In [22]:

```
map_clusters = folium.Map(location=[latitude, longitude], zoom_start=11)

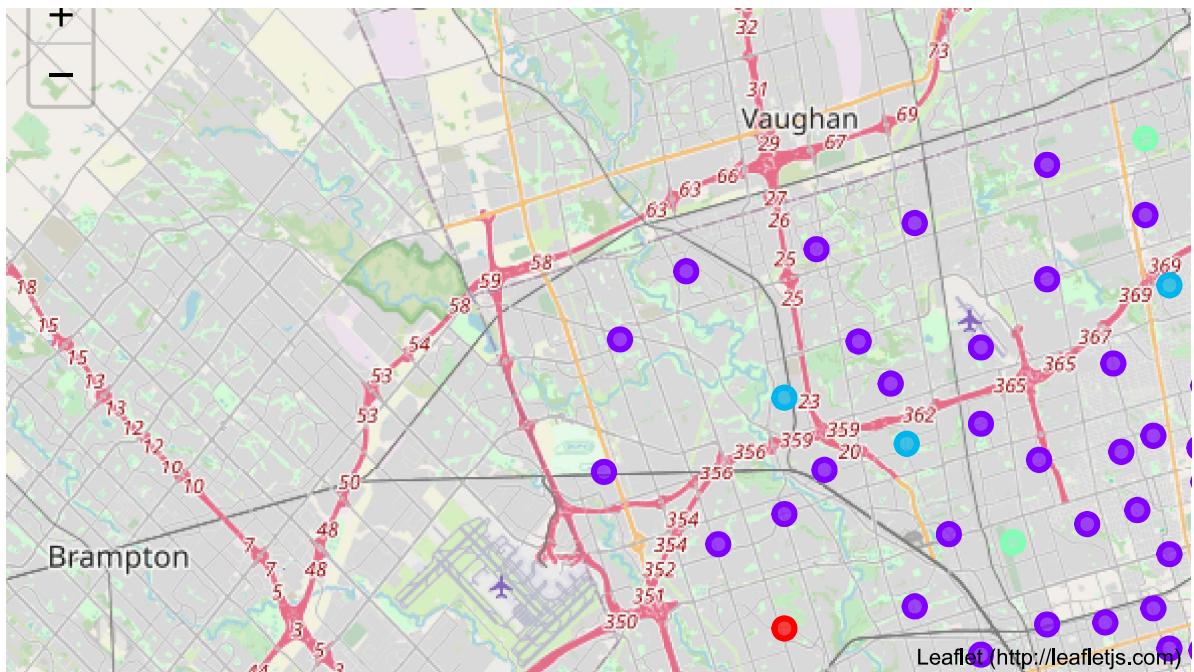

# set color scheme for the clusters
x = np.arange(5)
ys = [i + x + (i*x)**2 for i in range(5)]
colors_array = cm.rainbow(np.linspace(0, 1, len(ys)))
rainbow = [colors.rgb2hex(i) for i in colors_array]

# add markers to the map
markers_colors = []
for lat, lon, poi, cluster in zip(toronto_data['Latitude'], toronto_data['Longitude'],
label = folium.Popup(str(poi), parse_html=True)
folium.CircleMarker(
    [lat, lon],
    radius=5,
    popup=label,
    color=rainbow[cluster-1],
    fill=True,
    fill_color=rainbow[cluster-1],
    fill_opacity=0.7).add_to(map_clusters)

map_clusters
```

Out[22]:

as we see that there is clusters for ther results of neighbourhood which can help the person decide which nighbourhood will be suitable for him

## Conclusion

The People can easly choose the city they need to check for the top neighbourhood to move to and they will find the results wihch can help them choose the suitable neighbourhood form them
